

2 solar panels more efficient than 1: GERMI

Gujarat Energy Research and Management Institute (Germi) scientists have suggested a new approach which can enhance energy generated from photovoltaic (PV) panels. According to the study, Keeping two layers of PV panels as collectors of energy one above the other with the same size and orientation, has shown about 75% increase in efficiency as compared to a single solar panel. The study was conducted by Germi scientists Pragya Sharma and Prof T Harinarayana.
